SAIBO

OVAL TRACK SYSTEM

SAIBO provides a wide choice of sizes and options to build linear, curve motion system. All of components including linear guides, ring guides, bearings and lubricate parts are designed standard and modularized. Customer can select and build motion system easy and quickly.
SAIBO
- Rail Profiles are produced in German.Design and produce according to DIN standard.
- Ring rail radius are standard, Straight rail length is optional.
- Additional locating device realize carriages precision location.
- The connections between belt and carriages are flexible and torque protected.
- Raydent (corrosion protection) is optional for rail.

Straight Rail   Made of Germany high quality bearing steel
Deep hardened in working surfaces for high wear resistance
Ground Double 70° V working edges together to ensure parallelism
Soft rail body for customization machining process
Provide 3 standard sizes for customer's selection
Two precision rails G1 and G3 is optional, ground and un-ground
Precision G3 rail length could be up to 5.5meters without connection
Longer length (Unlimited) can be achieved by Connection

Ring Rail   Made of high quality bearing steel
Deep hardened in working surfaces for high wear resistance
Ground Double 70° V working edge ensure parallelism
All surfaces are ground for precision
Provide wide range of standard sizes
Customized assembly holes are available

Precision   SAIBO provides two precision grades. G1 ground and G3 unground. Here we must emphasize that G3 grade's motion is also very smooth and stable. It is fit for smooth running without very high precision and low cost request. But when linear rail connect ring rail, it must be G1 grade.
$\triangledown$ ground surface

G1 grade   G3 grade
Rollers

Made of high quality bearing steel
Whole body hardened for high wear resistance
Supply Twin and Double row bearings
(See below figure)
Concentric / Eccentric bolt supplied

□ Twin bearing   ▦ Double row bearing

Performance

Radial load capacity | Axial load capacity | Speed | Smoothness | misalignment tolerance | Rigidity | Dust tolerance | Price

Floating Bearing

Outer ring could float in axial direction to compensate installation parallelism
Made of high quality bearing steel
Whole body hardened for high wear resistance
Concentric / Eccentric bolt supplied

Floating Space

Roller Type Selection   SS SVR 25 RS DR C

Bolt Type, C :concentric, E: Eccentric, DE: Double Eccentric for Curve Rail

Roller Internal Structure (DR ; Double Balls Roller, F; Floating Roller, Vacant is Twin Bearing.)

SAIBO

Assembly manual

1. Match rollers to carriage plate

Please mount the concentric bearing to one side of carriage plate, and eccentric bearing to the other side following the direction of railway. In case of circle motion carriage, the concentric bearing should be mounted to the side where mounting-hole distance is shorter. Please refer to below picture.

For concentric bearing

For eccentric bearing
Circle motion carriage plate

2. Mounting to railway

Carriage assembly should be mounted from the end of railway. Please do not put any overstress when mounting.

3. Adjust the clearance between bearing and railway

-Tighten concentric bearings first.

-Then rotate eccentric bearing via rotate hexagonal key at the end of stud to adjust the clearance between railway and bearing.

-Adjust the clearance to zero.

-Slide the carriage by hand and adjust to the extent where there causes a slight slipping resistance.

Correct condition is where moving power becomes the recommended value as below table by putting load by push-pull gauge to the running direction of carriage.

Recommended pre-load by push-pull gauge

V track bearing size	Pre-load(N)
25	4
44	8
76	12

-Keep eccentric bearing's position and tighten the nut.

Important note

Appropriate pre-load provide the system rigidity. However, over preload will decrease system's life rapidly. Please be careful.

Load / Life calculation

Due to the hardness of the railway and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by roller's life. Load capacity of the motion guide system varies mainly by the size of bearing and railway, lubricated or not, and the load magnitude and direction. Other factors include speed and acceleration and environment etc. To calculate system life, loading factor LF should be calculated firstly. Here we provide two methods to calculate the loading factor.

Standard 4 bearings carriage calculation

If the system use SAIBO standard 4 bearings carriage, then calculation can use below formula.

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$
Fy - Actual load in Y direction. (N)

Fz - Actual load in Z direction. (N)

Mx - Actual moment in X direction. (N·m)

My - Actual moment in Y direction. (N·m)

Mz - Actual moment in Z direction. (N·m)

Below parameters can be taken from the table of Load capacity.

Fy max - Max load capacity in Y direction. (N)

Fz max - Max load capacity in Z direction. (N)

Mx max - Max moment capacity in X direction. (N·m)

My max - Max moment capacity in Y direction. (N·m)

Mz max - Max moment capacity in Z direction. (N·m)

Roller load factor If the system does not use SAIBO standard 4 roller carriage, It is necessary to calculate each roller's loading factor. Biggest loaded roller's load determines the system's life.
$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax}$$

LF - Loading factor

LF should be less than 1.0 for any combination of load

Fy - Actual axial capacity. (N)

Fz - Actual radial capacity. (N)

Below parameters can be taken from below table.

Fy max - Max axial load. (N)

Fz max - Max radial load. (N)

Roller's load capacity   Please refer to page 13.

Life calculation   After getting Loading Factor LF, the life in km can be calculated by selecting one of below two formulas. The basic life can be taken from table below.

Dry system
$$Life(km) = \frac{Basic\_life}{(0.03+0.97LF*f)^2}$$

Lubricated system
$$Life(km) = \frac{Basic\_life}{(0.03+0.97LF*f)^3}$$

Basic life

Bearing type	Dry system	Lubricated system
SVR-25	100	150
SVR-34	100	150
SVR-54	150	250

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

Calculation example A machine use SB-LGV25 spacer railway and standard carriage. The carriage and work-piece total weight 8 kg. When the carriage moving, there is an external load of 50 N exerted as below drawing. Working environment is clean. There is none vibration or shock.
The load factor LF is calculated use formula

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

$Fy = 8kg \times 9.8 \text{ (gravity)} = 78.40 \text{ N}$

$Fz = 50 \text{ N}$

$Mx = 50 \times 0.05 = 2.5 \text{ N·m}$

$My = 0$

$Mz = 0$

Take parameters Fy max, Fz max, Mx max, My max, Mz max from table and then fill in the formula

$$\text{LF} = \frac{78.4}{1280} + \frac{50}{1200} + \frac{2.5}{14} + \frac{0}{Mymax} + \frac{0}{Mzmax} = 0.2816$$

Then life (km) calculation can use formula as below:

Dry system

$$\text{Life(km)} = \frac{Basic\_life}{(0.03+0.97LF*f)^2}$$

Basic life is 100km.

According to the description of working condition, take f=1.3.

$$\text{Life(km)} = \frac{100}{(0.03+0.97*0.2816*1.3)^2} = 674km$$

Lubricated system   Basic life is 150 km, take f=1.1

$$\text{Life(km)} = \frac{Basic\_life}{(0.03+0.97LF*f)^3}$$

$$\text{Life(km)} = \frac{150}{(0.03+0.97*0.2816*1.1)^3} = 4155km$$

From this example, it shows clearly that lubrication is so important for the life. Please pay attention to install the lubrication system for your system.
